

The M2 is a new modular loudspeaker concept developed by Mark Levinson and his associates. Because of its modular design, the M2 can be used to create a wide variety of systems, from simple two channel, using a pair of M2's, to more elaborate surround sound or multi channel arrays utilizing stacks of 2, 4, or 8 M2's per channel. Each array can be driven from a medium power amplifier. The new M1 Multi Channel Amplifier is an ideal way to power virtually any M2 system. For those who want more power, M2's can take advantage of the most powerful amps on the market like the Affirmation.

This illustration shows one of many possible arrays.

The top four M2's on the left and right reproduce the left and right front channels. The lower two M2's on each side reproduce the mono center channel, creating an image which emanates directly from the center of the screen, without having to have an actual speaker in the center. This is ideal for applications where there is a picture window, fireplace, or other design consideration which precludes a box in the middle. The two M3 subwoofers each contain their own 200W mono amplifier with custom trim adjustments to fine tune bass performance for the room. The M2's and subwoofers can be mounted free standing, on-wall or in-wall, as the application requires. Technical assistance is available from our NY office for design consultation and recommendations.

For the system designer, the M2 offers freedom from having to keep track of dozens of models that come and go, each offering pros and cons. If the needs of the customer change over time, more M2's can be added to produce the desired results. The threaded metal inserts on the sides and rear of the M2 enable the speaker to be mounted in many different ways. They can be fastened to a wall directly from behind with four screws that go through the wall; to a rear panel that is hinged or motorized; to aluminum or polished stainless steel L-brackets that pick up all the threaded inserts; and mounted on a virtually infinite variety of stands, ready made or custom, according to the design requirements of the environment.

A four inch wide channel in the rear of the M2 on center allows for series parallel wiring harnesses to be used while mounting the speaker flat to the wall. Brass bolts provide solid connections that will not come loose over time.

The large ribbon tweeter and 6.5" woofer are both custom made to the highest quality standards. Every component in the construction of the M2 has been carefully chosen by experienced designers and craftsmen using science and the ear to provide the best performance and reliability.

Most important, the M2 offers the ultimate in sonic quality. Mark Levinson invites people to record musical events and play them back through the M2's. Musicians agree that the sound coming from the M2's is the most natural and lifelike they have heard, and are amazed at the ability of the M2 to reproduce both the power and subtlety of their instruments and voices. This is why the M2 never goes out of style and will provide decades of excellent service to the most demanding listeners.
